# Website

During practical training at Gibb and in my free time, I created my own website. You can now view this website on the imsbern/ims2022 server, alongside the websites created by my classmates.

## Initial Situation

I had to create the website without any prior knowledge. This required developing a concept where I outlined the goals or requirements that the final product, the website, should fulfill. I had to teach myself the necessary skills since we only received a brief assignment sheet from Gibb. Ultimately, I learned everything from W3Schools and a few other websites.

## Goal

The goal was to create a website with at least five pages using CSS and HTML within the given 10-week time limit, ensuring that it is easy to navigate.

## Implementation

At the start, I faced difficulties because I wasn't sure how to proceed. I followed tutorials on W3Schools, and after some time, I started coding without any additional help. I only needed some assistance from the internet for animations and navigation. I didn't use any original images for the website but instead opted for royalty-free images from the internet. The only exception is the logo, which I created myself. After submitting the website, I made several improvements: I added a login feature and enhanced the website's layout.
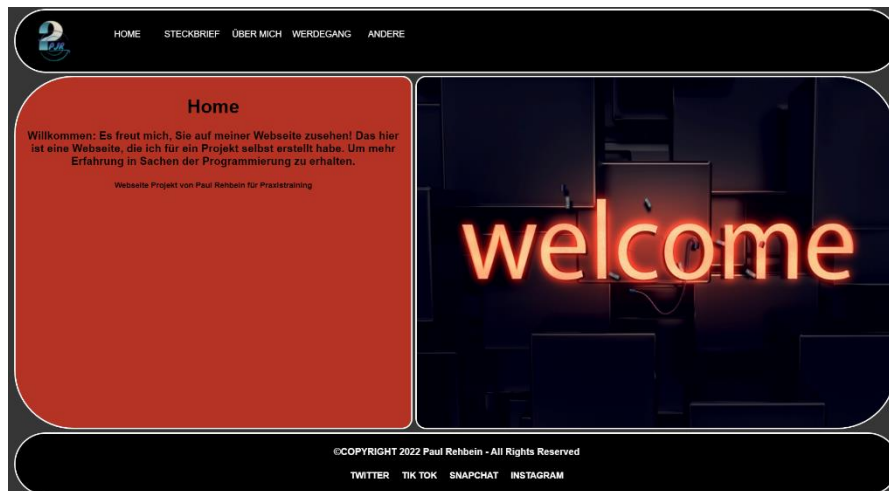

## Result

I am satisfied with the result. It has a clear interface, and I like the animations featured on the website. I met the requirements outlined in the concept, although I did have to make some changes, such as adjusting the colors to create a more pleasant interface. I received a certificate for the website with a grade of 6.

## Insights

After completing the project, I am now capable of creating a fully functional website. I can write CSS and HTML without any external help. I can adhere to a given schedule and set requirements that align with the allotted time..
